

The `isodate` package*

Harald Harders
h.harders@tu-bs.de

File Date 2001-05-04, Printed 2001-05-17

Abstract

This package provides commands to switch between different date formats (standard, ISO, numeric, L^AT_EX package). They are used by the `\today` command, by the `\printdate` and `\printdateTeX` commands that print any date, and by the `\daterange` command that prints a date range. At the moment this package supports German (old and new rules, Austrian), British English, US English, French, Danish, and Norwegian.

The idea for this package was taken from the `akletter` class.

Contents

1	Commands	2

*This file has version 2.04 last revised 2001-05-04, documentation dated 2001-05-17.

E	The implementation	7
E.1	Package file isodate.sty	7
E.2	Language definition file danish.idf	13
E.3	Language definition file english.idf	15
E.4	Language definition file french.idf	20
E.5	Language definition file german.idf	21
E.6	Language definition file norsk.idf	24

Acknowledgements

First of all I have to thank Axel Kielhorn who wrote the package `akletter` which inspired me to write `isodate`. The help of Heiko Oberdiek was necessary to handle characters in substrings which resulted in the package `substr`. David Sanderson found the bug which disabled `isodate` to work without `babel`. He also helped me to improve the documentation and sent me a link to the ISO 8601 norm [1]. Svend Tollak Munkejord has added the norwegian language.

1 Commands

1.1 Switching the date format

This package provides five commands to switch the output format of all commands that print dates (described later):

	<code>\isodate</code>	date format described in ISO 8601 and DIN 5008 [1] (yyyy-mm-dd)
	<code>\numdate</code>	numeric date format with four digits of the year
<code>\isodate</code>	<code>\shortdate</code>	short numeric date format with two digits of the year
<code>\numdate</code>	<code>\TeXdate</code>	date format used for version description of packages (yyyy/mm/dd)
<code>\shortdate</code>	<code>\origdate</code>	original L ^A T _E X format
<code>\TeXdate</code>		
<code>\origdate</code>		

The numeric and short numeric format change their behaviour depending on the actual language:

German, nGerman	<code>dd.\,mm.\~yyyy</code>	resp.	<code>dd.\,mm.\,yy</code>
US English	<code>mm/dd/yyyy</code>	resp.	<code>mm/dd/yy</code>
other languages	<code>dd/mm/yyyy</code>	resp.	<code>dd/mm/yy</code>

This package supports German (old and new rules, Austrian), US English, French, Danish, and Norwegian. Switching the language by using `\selectlanguage` does *not* switch back to the original date format. So the current date format stays active when changing the language.

The change of the date format works locally. So it is possible to change it locally inside a group. E.g.

```
\today, {\origdate\today}, \today
```

leads to “2001-05-17, 17th May 2001, 2001-05-17”.

1.2 Printing today's date

`\today` As usual the command `\today` prints the date of today. Its appearance is influenced by the current date format

1.3 Printing any date

`\printdate` The command `\printdate{#1}` prints any date in the current format. The argument may be a date in German, British English, or ISO format, e.g.

```
\printdate{24.12.2000}  
\printdate{24/12/2000}  
\printdate{2000-12-24}
```

`\printdateTeX` The command `\printdateTeX{#1}` prints any date in the actual format. The argument must be in the L^AT_EX format `yyyy/mm/dd`, e.g.

```
\printdateTeX{2000/12/24}
```

This command is useful for printing version information stored in a macro. For example the version of this documentation is stored in the macro `\docdate` (“2001/05/17”). To print it with the actual date format you can use the command `\printdateTeX{\docdate}` which leads to e.g. “2001-05-17” or “17th May 2001”.

1.4 Printing date ranges

`\daterange` The command `\daterange{#1}{#2}` prints a date range in the current format. The arguments may be a date in German, British English, or ISO format (see above). But there is a limitation: Both arguments must have the same input format.

Depending on the language and date format this commands lets out some of the data. The simplest way to understand it is to watch some examples:

```
{\isodate  
\daterange{1999-05-03}{1999-05-31} → 1999-05-03 to 31  
\daterange{1999-05-03}{1999-11-03} → 1999-05-03 to 11-03  
\daterange{1999-05-03}{2000-04-07} → 1999-05-03 to 2000-04-07  
}  
{\origdate  
\daterange{1999-05-03}{1999-05-31} → 3rd to 31st May 1999  
\daterange{1999-05-03}{1999-11-03} → 3rd May to 3rd November 1999  
\daterange{1999-05-03}{2000-04-07} → 3rd May 1999 to 7th April 2000  
}
```

1.5 Changing the ISO format

`\isodash` The ISO norm says that the date format is “yyyy-mm-dd” or “yyyymmdd” [1].

By default I use the hyphen “-” as separator. You can change this using the `\isodash`¹ command, e.g.

```
\printdate{24/12/2000},
\isodash{--}%
\printdate{24/12/2000},
\isodash{}%
\printdate{24/12/2000}
```

leads to “2000-12-24, 2000–12–24, 20001224”. Or for example

```
\isodash{${\cdot}}
\printdate{24/12/2000}
```

leads to “2000·12·24”.

1.6 Changing the German format

The spacings for the numerical formats in the German language (24.12.2000 resp. 24.12.00) was taken from the Duden [2] and is the default spacing when using one of the German derivatives. Some people want to use different spacings. Thus from version 2.03 on it will be possible to change it. You can change the spacing between the day and the month using the command `\daymonthsepgerman`. Using the command `\monthyearsepgerman` you can change the spacing between the month and the year for the long and the short format, e.g.

`\daymonthsepgerman`
`\monthyearsepgerman`

```
\daymonthsepgerman{\quad}%
\monthyearsepgerman{\qqquad}{\quad}%
{\numdate\printdate{24.12.2000}}, {\shortdate\printdate{24.12.2000}}
```

leads to “24. 12. 2000, 24. 12. 00”.

2 Calling the package

The package is called using the `\usepackage` command:

```
\usepackage[option]{isodate}.
```

The possible package options can be seen in table 1.

Be aware that at least one language option must be set when calling isodate.

The last language in the option list is the default language.

The package `isodate` works well together with `babel.sty`, `german.sty`, or `ngerman.sty`. Maybe it also works together with other language packages like e.g. `french.sty`, but this has not been tested. It does not matter if `isodate` is loaded before or after the used language package.

¹The name “isodash” is a little bit confusing and was chosen due to my limited knowledge in English. It should be named “isoseparator” or “isosep”. But for compatibility reasons I will not change it.

Table 1: Package options

option	function
<code>iso</code>	start with ISO date format
<code>num</code>	start with numeric date format with 4 digits of the year
<code>short</code>	start with numeric date format with 2 digits of the year
<code>TeX</code>	start with L ^A T _E X numeric date format (yyyy/mm/dd)
<code>orig</code>	start with normal L ^A T _E X date format (default)
<code>american</code>	support American English date format
<code>austrian</code>	support Austrian date format
<code>danish</code>	support Danish date format
<code>english</code>	support British English date format
<code>french</code>	support French date format
<code>german</code>	support German date format
<code>naustrian</code>	support new Austrian date format
<code>ngerman</code>	support new German date format
<code>norsk</code>	support Norwegian date format
<code>norwegian</code>	support Norwegian date format

It is also possible to use `isodate` without one of the language packages. Then it is not possible to switch between languages using the `\selectlanguage` command.² Then the default language is the last one in the option list. If an error occurs when using `isodate` without one of the packages `babel.sty`, `german.sty`, and `ngerman.sty` please run `tstlang.tex` through latex and send the file `tstlang.log` to the address `h.harders@tu-bs.de`.

If using `isodate` together with `babel` it can be useful to put the language options as global options into the optional parameters of the `\documentclass` command. Then automatically the available languages are the same for the text and the dates, and the default language is also the same. For example:

```
\documentclass[english,german]{article}
\usepackage{babel}
\usepackage[num]{isodate}
```

3 Add new languages to the package

The easiest way to add new languages to the package is to copy one of the simple language files `danish.idf` or `french.idf` to the new language name, e.g. `plattdeutsch.idf`, and change it as necessary.

This new file can be used without changing `isodate.sty` if you use its name explicitly in the optional parameter of the `\usepackage` command. If you have added support for a new language please mail me.

²Yes, there is a way to change the date language, but it is a little bit tricky:

```
\makeatletter
\def\iso@language{german}%
\dategerman%
\makeatother
```

4 Solvable problems

4.1 Redefinition of language dependent names

If someone wants to change one of the language dependent names (e.g. `\contentsname`, `\figurename`, ...) many people just write (e.g. in the language `ngerman`)

```
\renewcommand{\contentsname}{Inhalt}
```

in the preamble of the document. If they are using `german.sty`, `ngerman.sty`, or no language package (and not `isodate.sty`) this approach works. But when using `babel.sty` and/or `isodate.sty` the default (“Inhaltsverzeichnis”) results. This is due to the fact that these packages call the command `\selectlanguage` at the `\begin{document}`.

Depending on the used package different solutions have to be used.

Using `babel.sty` the redefinition of the name has to be added to the language extras:

```
\addto\extrasngerman{\renewcommand{\contentsname}{Inhalt}}
```

Using `german.sty` or `ngerman.sty` this approach does not work. Instead, the `\selectlanguage` command has to be redefined. First, the original command has to be copied via the `\let` command. Then the `\selectcommand` is redefined using the original command:

```
\let\origselectlanguage=\selectlanguage
\def\selectlanguage#1{\origselectlanguage{#1}%
  \iflanguage{ngerman}{\renewcommand{\contentsname}{Inhalt}}{%
  \iflanguage{german}{\renewcommand{\contentsname}{Inhalt}}{}}
\selectlanguage{ngerman}
```

These commands should be placed shortly before the `\begin{document}` command.

A Licence

This program can be redistributed and/or modified under the terms of the LaTeX Project Public License Distributed from CTAN archives in directory `macros/latex/base/lppl.txt`; either version 1 of the License, or any later version.

B Known errors

- The `\printdate` and `\printdateTeX` commands are not very good in checking the argument for correct syntax.
- I don't know the French word that should be used in a date range. So I have taken `~--~` (“ – ”).
- The language definition files `french.idf` and `german.idf` are not yet commented.

C Planned features and changes

- Of course eliminate the errors.
- Add other languages than German, new German, English, US English, French, Danish, and Norwegian. Please help me with this topic. I don't know the date formats in other languages.

E The implementation

E.1 Package file isodate.sty

Heading of the package:

```
1 \NeedsTeXFormat{LaTeX2e}
2 \ProvidesPackage{isodate}[\filedate\space v\fileversion
3   Change the output format of dates (HH)]
4 \RequirePackage{ifthen}
5 \RequirePackage{calc}
6 \IfFileExists{substr.sty}{\RequirePackage{substr}}%
7 }{\PackageError{isodate.sty}{Package file substr.sty not found}
8   {This version of isodate.sty needs the package substr.sty.^^J%
9     You can download it from
10    CTAN:/macros/latex/contrib/supported/substr/^^J%
11    E.g. one CTAN node is ftp.dante.de.
12    Install substr.sty into your TeX tree.}}
```

Declare the options for the default date format.

```
13 \DeclareOption{iso}{\AtBeginDocument{\isodate}}
14 \DeclareOption{num}{\AtBeginDocument{\numdate}}
15 \DeclareOption{short}{\AtBeginDocument{\shortdate}}
16 \DeclareOption{TeX}{\AtBeginDocument{\TeXdate}}
17 \DeclareOption{orig}{\AtBeginDocument{\origdate}}
```

Declare the options for language support.

```
18 \DeclareOption{austrian}{\input{german.idf}}
19 \DeclareOption{english}{\input{english.idf}}
20 \DeclareOption{german}{\input{german.idf}}
21 \DeclareOption{american}{\input{english.idf}}
22 \DeclareOption{naustrian}{\input{german.idf}}
23 \DeclareOption{ngerman}{\input{german.idf}}
24 \DeclareOption{UKenglish}{\input{english.idf}}
25 \DeclareOption{USenglish}{\input{english.idf}}
```

```

26 \DeclareOption{danish}{\input{danish.idf}}
27 \DeclareOption{norsk}{\input{norsk.idf}}
28 \DeclareOption{norwegian}{\input{norsk.idf}}
29 \DeclareOption{french}{\input{french.idf}}

```

Make it possible to load language definition files that are not known by this package.

```

30 \DeclareOption*{%
31   \InputIfFileExists{CurrentOption.idf}{}{%
32     \PackageError{isodate}{%
33       Isodate definition file CurrentOption.idf not found}{%
34       Maybe you misspelled the language option?}}%
35 }

```

Set default option to orig.

```
36 \ExecuteOptions{orig}
```

Process the options.

```
37 \ProcessOptions*
```

Handle the case that no language was given. Throw an error message. Each language definition file *.idf must contain a line

```
\let\iso@languageloaded\active
```

that defines the command \iso@languageloaded.

```

38 \ifx\iso@languageloaded\@undefined
39   \PackageError{isodate}{%
40     You haven't specified a language option}{%
41     You need to specify a language, either as a global
42     option\MessageBreak
43     or as an optional argument to the \string\usepackage\space
44     command.\MessageBreak
45     If you have used the old isodate package (version <=1.06) you can
46     change the\MessageBreak
47     usepackage command to \protect\usepackage{isodate}.\MessageBreak
48     You shouldn't try to proceed from here, type x to quit.}
49 \fi

```

`\printnumber` Prints a number. If the optional parameter is used the number has two digits and it is filled by “0”.

Examples: `\printnumber{4}` → 4, `\printnumber[g]{4}` → 04.

```

50 \newcommand{\printnumber}[2][\@empty]{%
51   \ifthenelse{\equal{#1}{\@empty}}{#2}{%
52     \ifthenelse{\number#2<10}{0}{#2}\number#2}%

```

`\iso@yeartwo` Prints the argument of the command with two digits.

Example: `\iso@yeartwo{1873}` → 73.

```

53 \newcounter{iso@yeartwo}%
54 \newcommand{\iso@yeartwo}[1]{%
55   \setcounter{iso@yeartwo}{\number#1}%
56   \whiledo{\theiso@yeartwo>99}{%
57     \setcounter{iso@yeartwo}{\theiso@yeartwo-100}}{%
58   \ifthenelse{\number\theiso@yeartwo<10}{0}{\theiso@yeartwo}%

```

`\iso@dateformat` In this command the current active date format ist stored. Possible values are: `numeric`, `short`, `iso`, `orig`, `TeX`.

```
59 \def\iso@dateformat{numeric}
```

`\numdate` Switches to long numerical date format.

```
60 \DeclareRobustCommand*\numdate{\def\iso@dateformat{numeric}}%
```

`\shortdate` Switches to short numerical date format.

```
61 \DeclareRobustCommand*\shortdate{\def\iso@dateformat{short}}%
```

`\isodate` Switches to ISO date format.

```
62 \DeclareRobustCommand*\isodate{\def\iso@dateformat{iso}}%
```

`\origdate` Switches to the original date format.

```
63 \DeclareRobustCommand*\origdate{\def\iso@dateformat{orig}}%
```

`\TeXdate` Switches to L^AT_EX date format.

```
64 \DeclareRobustCommand*\TeXdate{\def\iso@dateformat{TeX}}%
```

`\isodash` Changes the dash in the ISO date format. The default is “-”.

```
65 \def\iso@isodash{-}%
66 \DeclareRobustCommand*\isodash[1]{\def\iso@isodash{#1}}%
```

`\isorangesign` Defines the sign or word that is printed between the two dates in a date range. E.g. in English the default is “to”.

```
67 \def\iso@rangesign{\csname iso@rangesign@iso@language\endcsname}%
68 \DeclareRobustCommand*\isorangesign[1]{\def\iso@rangesign{#1}}%
```

`\iso@printdate` Defines the command `iso@printdate` which takes three arguments (year, month, day) and prints the date by using the `\today` command.

```
69 \newcommand\iso@printdate[3]{%
70   \begingroup%
71   \def\year{#1}%
72   \def\month{#2}%
73   \def\day{#3}%
74   \today%
75   \endgroup%
76 }
```

`\printdate` Prints a date that is given as one argument in one of these formats: `yyyy-mm-dd`, `dd/mm/yyyy`, `dd.mm.yyyy`.

```
77 \DeclareRobustCommand*\printdate[1]{%
78   \edef\iso@date{#1}%
79   \SubStringsToCounter{iso@slash}{/}{\iso@date}%
80   \SubStringsToCounter{iso@minus}{-}{\iso@date}%
81   \SubStringsToCounter{iso@dot}{.}{\iso@date}%
82   \ifthenelse{equal{\theiso@dot}{2}}{%
83     \expandafter\iso@input@german\iso@date\@empty}{%
```

Define `\iso@date` command to expand the argument #1.

Count appearances of “/”, “-”, and “.” in the argument.

If number of “.” in the argument is equal to 2 then the German format `dd.mm.yyyy` is used.

If number of “-” in the argument is equal to 2 then the ISO format yyyy-mm-dd is used.

```

\iso@range@input@german  Converts a string with the format dd.mm.yyyy,dd.mm.yyyy to six arguments
                        {#3}{#2}{#1}{#6}{#5}{#4} and calls \iso@daterange@language.
147 \def\iso@range@input@german#1.#2.#3,#4.#5.#6\@empty{%
148   \csname iso@daterange@\iso@languagename\endcsname{%
149     #3}{#2}{#1}{#6}{#5}{#4}}

\iso@range@input@english  Converts a string with the format dd/mm/yyyy,dd/mm/yyyy to six arguments
                          {#3}{#2}{#1}{#6}{#5}{#4} and calls \iso@daterange@language.
150 \def\iso@range@input@english#1/#2/#3,#4/#5/#6\@empty{%
151   \csname iso@daterange@\iso@languagename\endcsname{%
152     #3}{#2}{#1}{#6}{#5}{#4}}

Define the counters for counting the appearances of “.”, “-”, and “/” in the arguments.
153 \newcounter{iso@slash}
154 \newcounter{iso@minus}
155 \newcounter{iso@dot}
156 \newcounter{iso@@@slash}
157 \newcounter{iso@@@minus}
158 \newcounter{iso@@@dot}

The command \iso@languagename is defined to be able to use this package without
loading one of the language packages babel.sty, german.sty, or ngerman.sty.
If neither babel.sty nor german.sty nor ngerman.sty is loaded my computer
returns “nohyphenation” when using \languagename. So this is the indication
that none of the above packages is loaded.
159 \AtBeginDocument{%
160   \ifthenelse{\not\equal{\languagename}{nohyphenation}}{%

The language is not equal “nohyphenation”. So one of the language packages is
loaded. Replace the internal language name \iso@languagename by the global
language name \languagename.
161   \gdef\iso@languagename{\languagename}%

Reload language to surely switch to new date format. The languagename gets first
expanded because of errors that would occur otherwise.

Change History

2.00	General: Total reimplementa- tion of the package. The old package has renamed to isodateo.	1	2.02	General: Added Norwegian lan- guage by Svend Tollak Munke- jord	24
2.01	General: For the case that none of the packages babel, german, and ngerman is loaded there is a new macro <code>\iso@languagename</code> that contains the name of the last loaded language. If one of the packages is loaded it con- tains the current language.	1	2.03	General: Allow change of spaces for German language	4, 22
	Handle case of not loaded lan- guage package babel, german and ngerman	12		Fixed a bug in the French lan- guage that caused not to switch to it correctly on startup.	21
			2.04	General: Added section for solvable problems.	6
